Fluoride Treatments May Help Prevent Childhood Cavities!

Fluoride treatments, (routinely given to our patients with a six month checkup), are being studied by the University of San Francisco School of Dentistry. The research findings show that routine fluoride treatments significantly decrease the incidence of children's cavities.

(ada.org/goto/sciencenews) If you are not sure about the amount of fluoride in your drinking water, call your water company. Fluoride can vary in different sections of the city. Fluoride is usually measured in parts per million.

Back to School Checkup: Send your child off to school with a healthy mouth!

- ◆ Dental checkups should be a regular part of the back to school preparation
- ◆ More than 1/2 of all children aged 5 to 9 years old have at least one cavity or filling
- ◆ Cleanings and fluoride treatments are "smile" insurance (that is they identify problems is the early stages)
- ◆ Besides a checkup, it may be time for a new toothbrush! The ADA recommends changing your toothbrush every 3 to 4 months.

5 Steps to a Healthy Smile

1. Don't wait until it's too late! Make your regular checkups a priority
2. Floss is the boss! Floss once a day
3. Eat and drink, just be sure to think. Eat a well balanced diet, and don't hide candy under the bed.
4. Be good to your gums. Keep an eye out for red, puffy or tender gums.
5. It takes awhile to brush your smile. Take at least two minutes to brush carefully.

HISTORICAL FACTS

5000 BC a Sumerian text describes "tooth worms" as the cause of dental decay.

500-300 BC

Hippocrates and Aristotle write about dentistry, including treating decayed teeth and gum disease
